

Progress in research, development, and commercialisation at Silentium Defence

James Palmer

In this presentation, I will provide an update on recent progress at Silentium Defence on our research, development, and commercialisation activities. This will include a high-level overview of Silentium Defence's passive radar products, recent progress in establishing our space observatory (with support of the Australian Space Agency's International Space Investment: Expand Capability grant, and our project partners Western Sydney University and Swedish Space Corporation) and an indication on our future directions. The presentation will cover Silentium Defence's MAVERICK family of passive radar systems as well as the support tools MAPIT and MERLIN.
